

DISTILAZYME® BG

β -glucanase enzyme selected for its ability to break down β -glucans in grain spirits production

Technical Data Sheet

APPLICATIONS:

- DistilaZyme® BG is a liquid β -glucanase enzyme complex, derived from fermentation of *Trichoderma reesei*.
- DistilaZyme BG mainly consists of an endo- β -glucanase that hydrolyzes (1-3) or (1-4) linkages in β -d-glucans.
- DistilaZyme BG has been selected especially for its ability to break down β -glucans, that is present in rye, barley, wheat and other cereals, resulting in reduced viscosity, making pumping easier after mashing.
- DistilaZyme BG and DistilaZyme AA activities synergize during mashing.
- DistilaZyme BG displays an optimum activity at a pH range of 4.5 - 6.0 and at a temperature range of 55 – 65°C (130 -150°F).

RESULTS WITH DISTILAZYME BG:

DistilaZyme BG has a working temperature and pH range that complies with standard industry cooking parameters.

Figure 1 allows you to easily see where your process fits and if any adjustments need to be made.

Figure 1: Temperature activity curve for DistilaZyme BG.

DISTILAZYME® BG

B-glucanase enzyme selected for its ability to break down B-glucans in grain spirits production

Technical Data Sheet

CHARACTERISTICS:

- Specific Gravity: 1.15 – 1.25
- Colour: Amber (however colour can vary slightly from batch to batch)

DistilaZyme BG is of food grade and produced from a non-GMO culture.

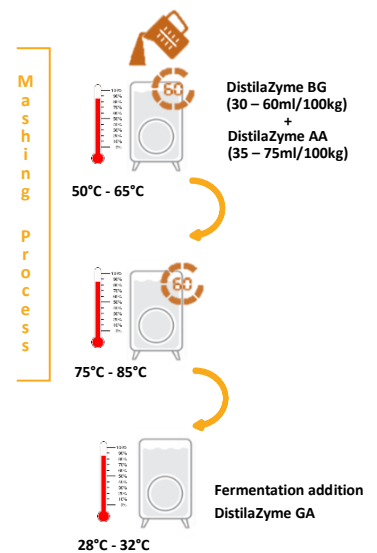

DOSAGE:

- For mashing, the recommended dose is 30 – 60 millilitres per 100 kilograms of grain added to the mash/cook tank. We recommend a high dosage when a high proportion of rye is used.
- The optimal enzyme dosage is variable according to individual distillery production processes and goals.

INSTRUCTIONS OF USE:

Lallemand Biofuels & Distilled Spirits recommends using DistilaZyme BG as follows:

1. These instructions of use are intended as a guide for general procedures; however, it is likely that temperature, dosage and timing will need to be tailored to your specific process.
2. Start the mashing process with the addition of grain to cool water (< 35°C). While mixing, increase the temperature to 55-65°C and add DistilaZyme BG and DistilaZyme AA.
3. A hold time of 60 minutes at 55-65°C is recommended to complete the breakdown of the β -glucans by DistilaZyme BG (within these temperatures, DistilaZyme AA will start to work).
4. After 1 hour, increase the temperature to 75-85°C to allow DistilaZyme AA to complete the breakdown of the starch into dextrans. Again, a hold time of 1 hour is recommended. The temperature of mashing will depend on the grain used.
5. After mashing is complete, cool to 28-32°C and pump the mash into the fermentation tank. Add DistilaZyme GA to convert the dextrans into fermentable sugars (*please see the TDS of DistilaZyme GA for further information*).

STORAGE, HANDLING & PACKAGING:

- DistilaZyme BG should be stored in a cool (5°C) and dry area away from heat and direct sunlight for maximum stability.
- Shelf Life: 18 months if stored < 5°C.
- Packaging: Worldwide, DistilaZyme BG is available in 1kg. In North America DistilaZyme BG is available in 1kg and 25kg.
